

Efficient Live Migration of Linux Containers

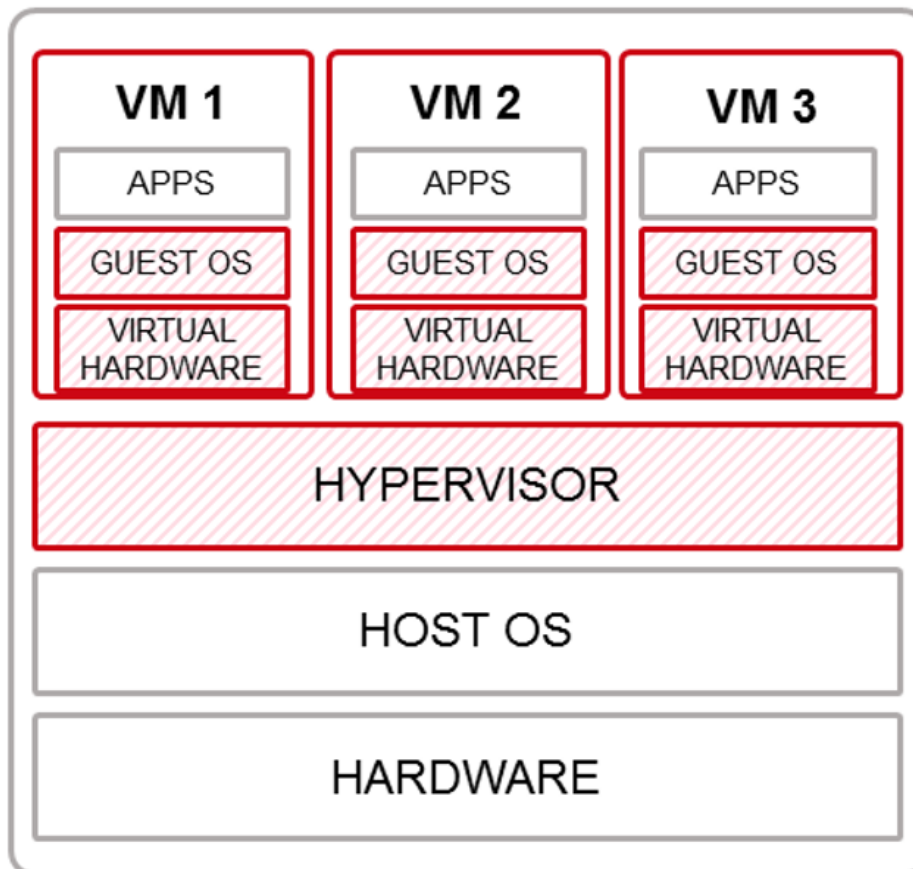

13th Workshop on Virtualization in High-Performance Cloud Computing VHPC '18

ISC-HPC, June 28, 2018, Frankfurt, Germany

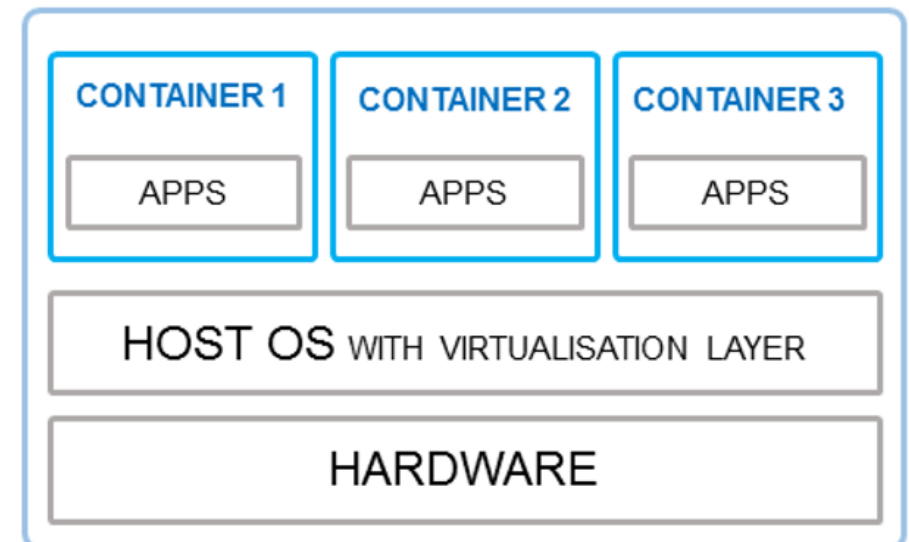

Radostin Stoyanov < r.stoyanov.14@aberdeen.ac.uk >

Motivation

VIRTUAL MACHINES

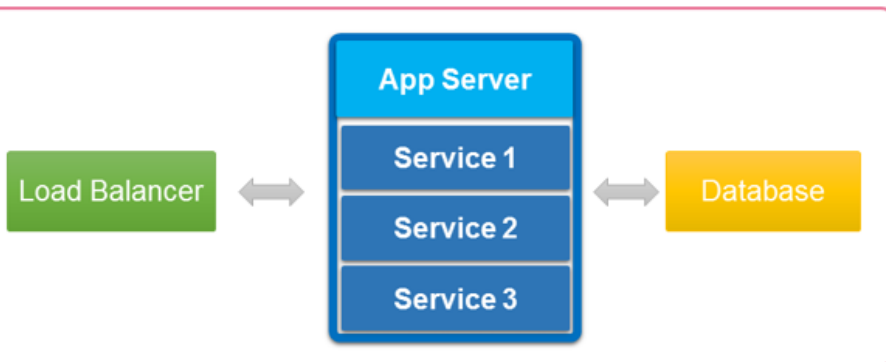

CONTAINERS

- HIGHER DENSITY
- INCREASED PORTABILITY
- ADVANCED SCALABILITY

Motivation

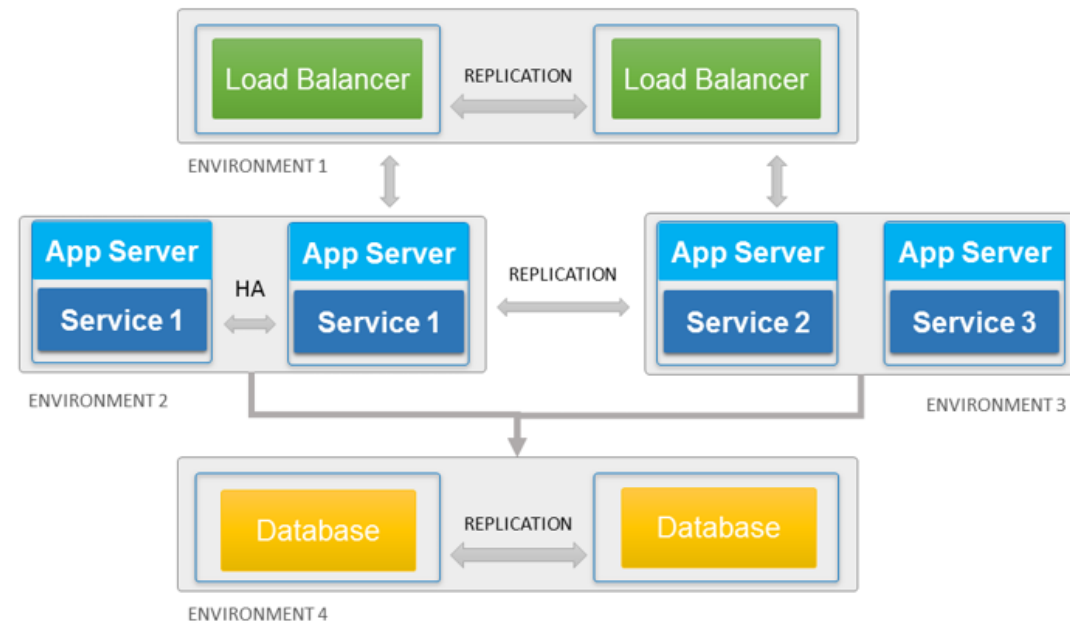

MONOLITHIC APPLICATION

Single monolithic VM

- Often redeploy everything
- Mutual dependencies slow down development
- Long QA cycle leads to less often updates
- High risk of failure or VM overload
- Difficult to scale

MICROSERVICES

Multiple Containers

- Modularity
- Deployed and updated independently
- Easy to scale and maintain
- Flexible architecture

Motivation

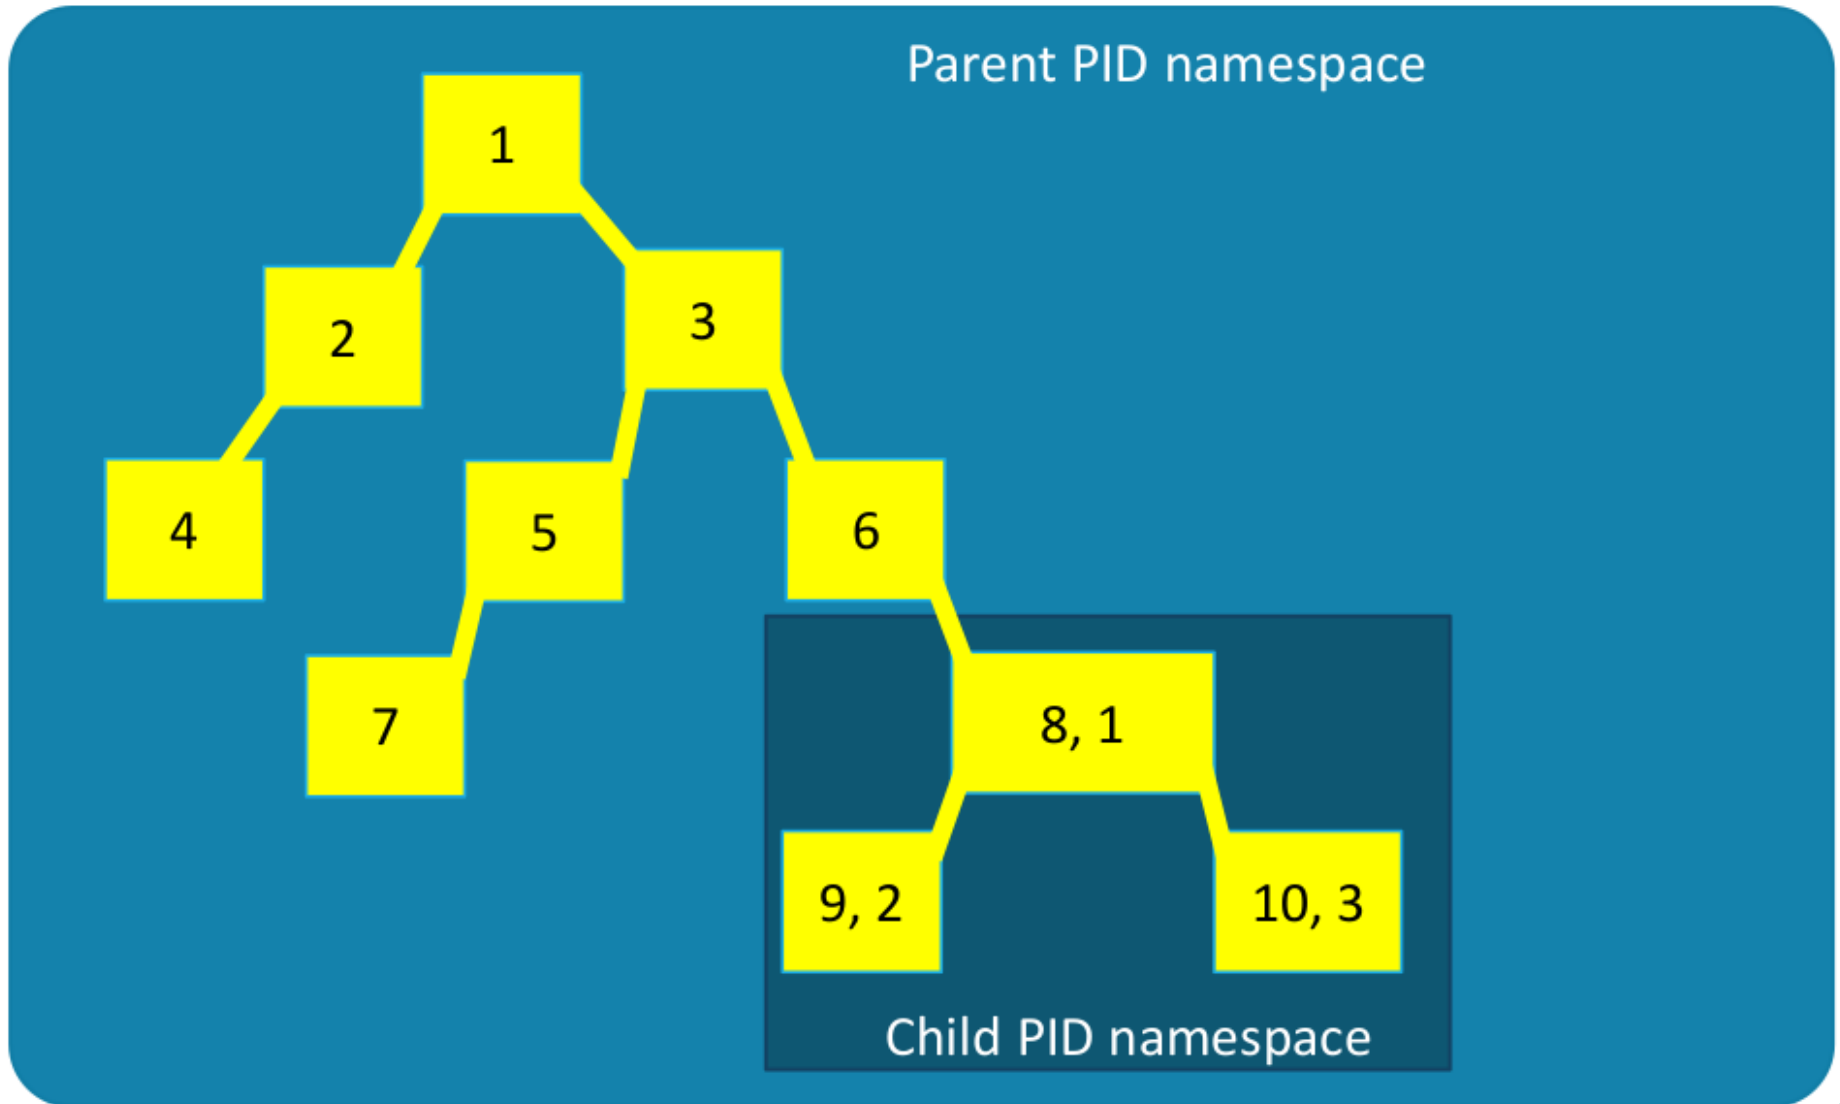

Virtualisation Technologies

Container-based Virtualisation
Checkpoint and Restore in Userspace

Linux Namespaces

Linux Control Groups

- Resource limits
-
- Prioritisation
- Control

Checkpoint and Restore in Userspace

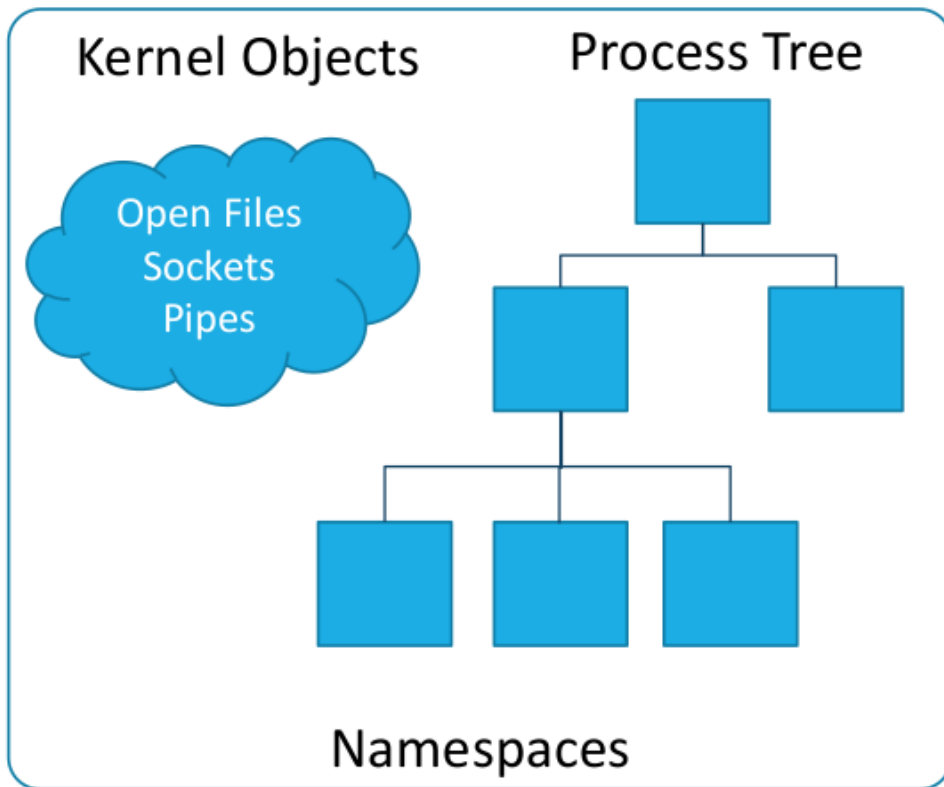

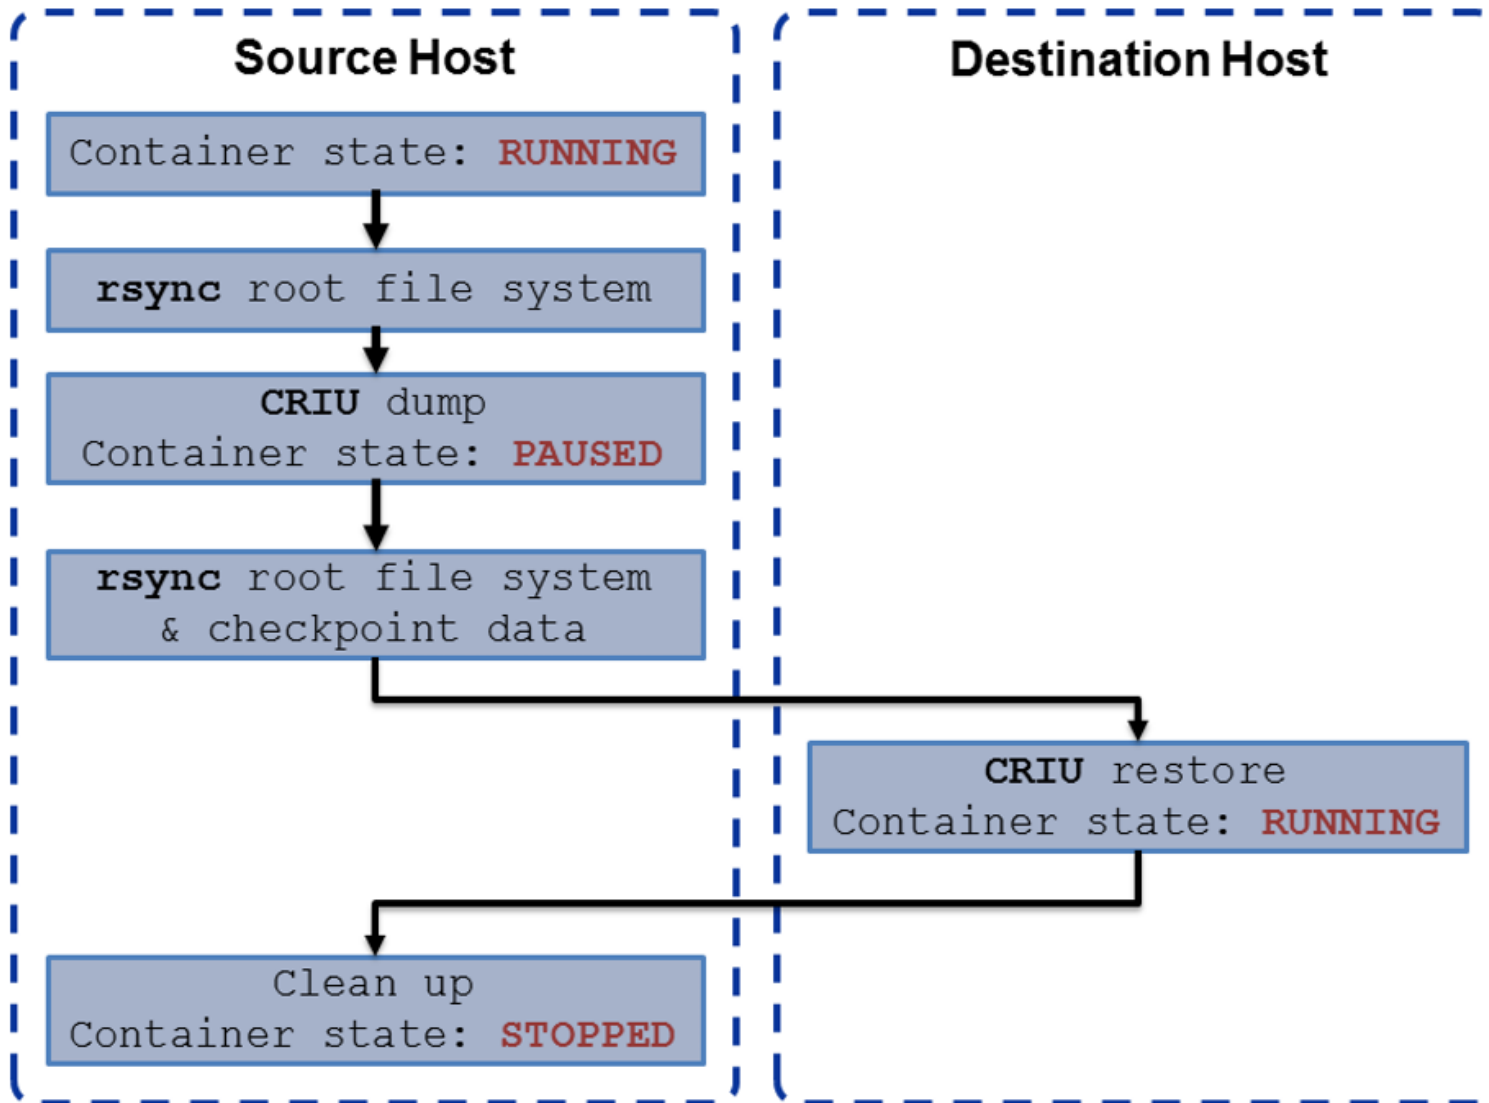

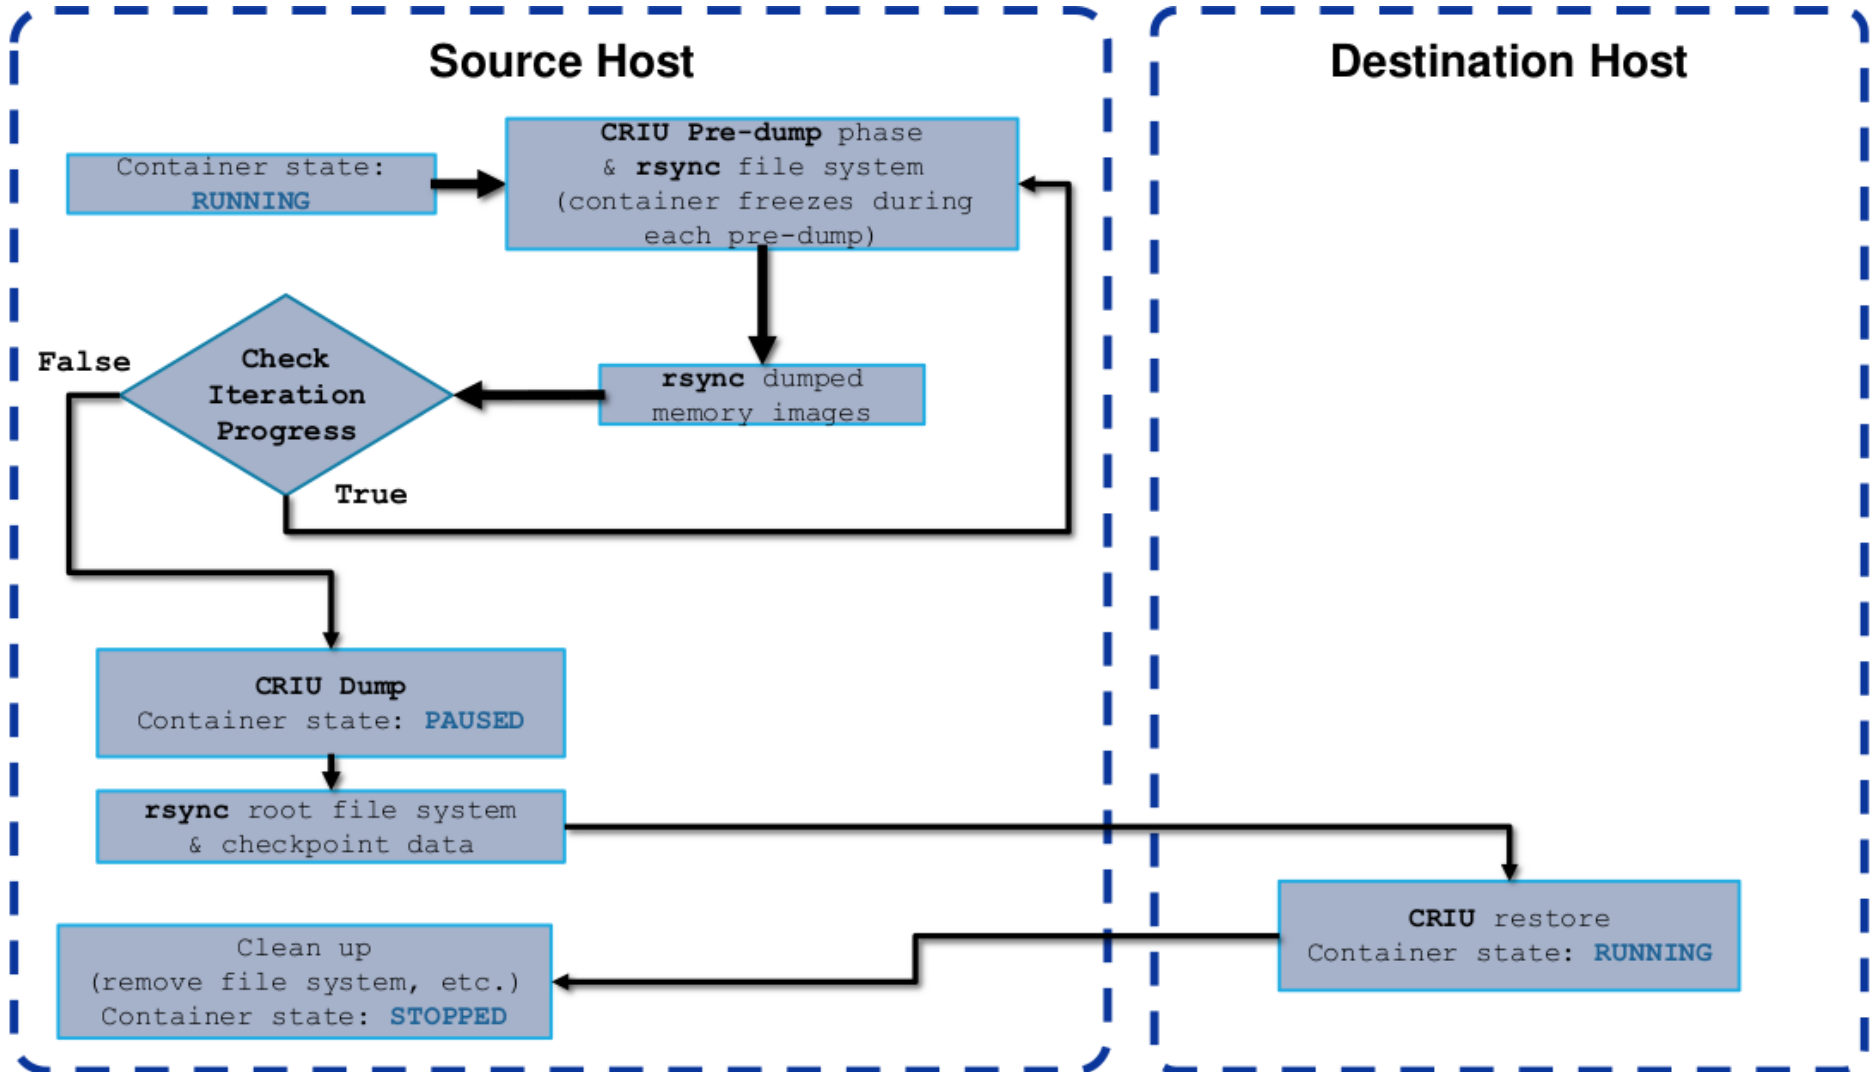

Image files

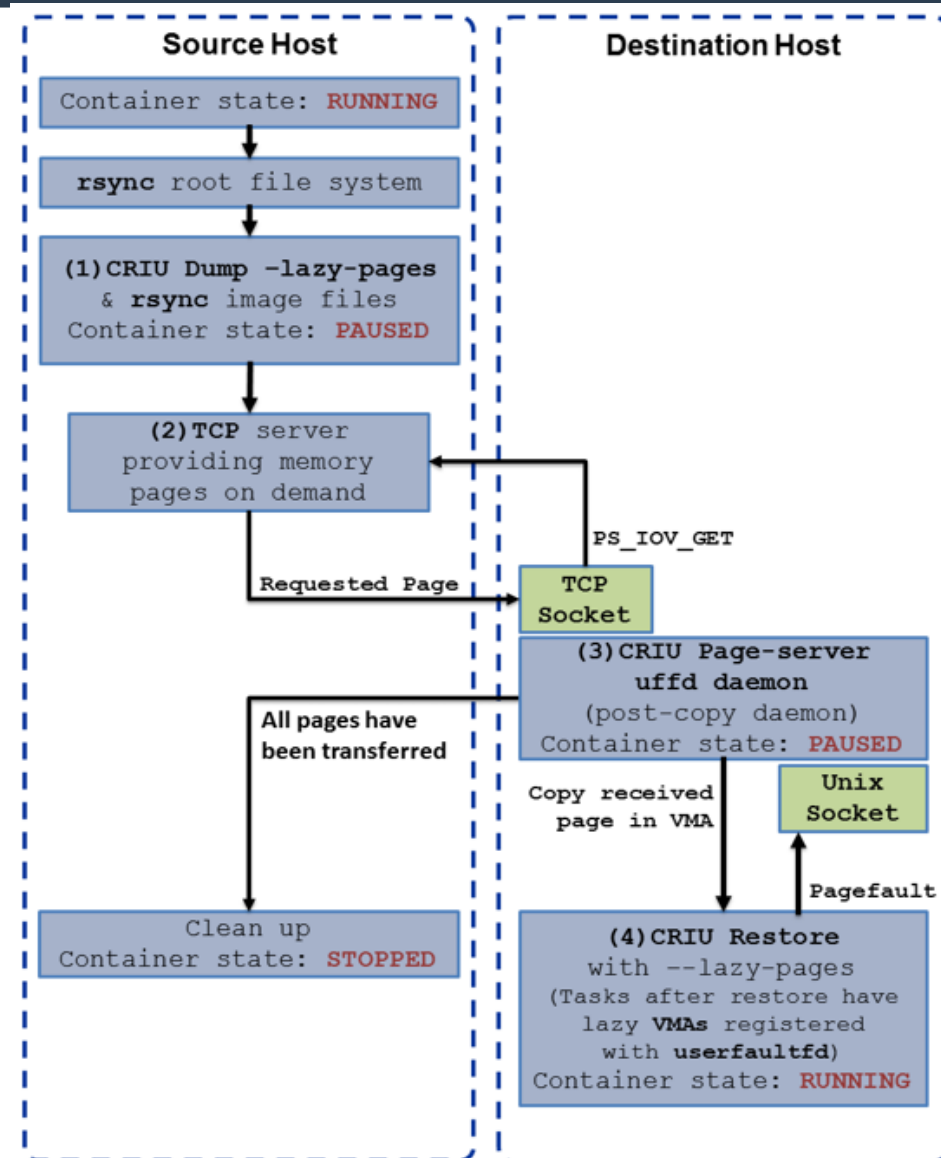

Native Live Migration

Pre-copy Live Migration

Post-copy Live Migration

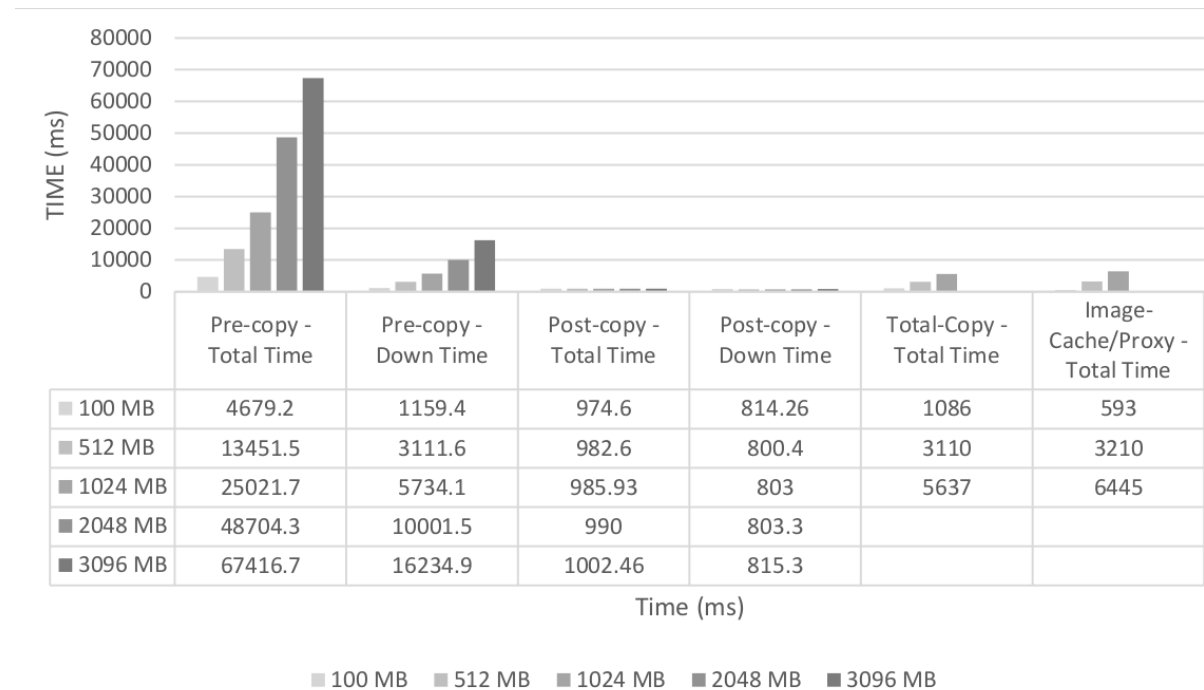

Evaluation - Experimental Design

Algorithm

- Pre-copy
- Post-copy
- Native
- Image-Cache/Proxy

Application memhog

Conclusion & Future work

- Identifying Writable Working Set
- Resource Usage Control During Live Migration
- Delta Compression Based Memory Transfer
- Post-copy Bubbling with Multiple Pivots

Thank you!
